

# EMERGING DISRUPTIVE TECHNOLOGY FORECASTING

## DSTG

Noetic designed, developed and facilitated a technology foresight series in collaboration with Defence Science Technology Group (DSTG) that included a 2-day workshop event design, visualisation, data collection and analysis.

### Overview

DSTG ran a series of research campaigns with Noetic, seeking to forecast emerging disruptive technology within specific technology themes. Our challenge was to design an engaging research experience informed by academia, defence and industry.

Noetic developed an insights paper which became the scope for a 2-day event. The design of this event encouraged participants to bring their expertise to a unique technology foresight process. Past symposium topics included biotechnology, digital disruption, space technologies, agile command & control, remote undersea surveillance and quantum computing.

### Outcome

The EDTAS research series continues to run successfully, enabling DSTG to prioritise technology development for military implication, and provide insight for defence research investment decisions.
